

WF75 INTERNAL TRAINING PACKET

AI Workflow Clarity Sprint Monetization Training

How the first monetization plan works, what Randall needs to know, and what must be prepared before a private pilot.

Truth status: This is internal training. WF75 is not customer-ready yet. QA still blocks private-pilot-prep readiness until stronger evidence, one-niche focus, one-page offer, and intake script are complete.

CURRENT STATE Internal-demo-ready, not customer-ready	FIRST OFFER AI Workflow Clarity Sprint	FIRST NICHE HVAC or Plumbing
QA DECISION internal_only	PILOT READY False	PRICE TEST \$500-\$750 beta

Executive Summary

The first monetization plan is a fixed-scope AI Workflow Clarity Sprint for a low-regulation local service business. The likely first target is HVAC or plumbing. The sale is not an AI system, not a guarantee, and not a public SaaS launch. The sale is clarity: map one painful workflow, identify failure points, show a safe synthetic demo, and produce an implementation-ready plan.

Generated 2026-07-03T19:39:22Z. Source status: board phase3_internal_demo_ready_evidence_warning_private_pilot_blocked; Research Scout warning; QA warning; QA decision internal_only.

TRAINING MODULE 01

Blunt Current Verdict

The AI Drop-Service OS foundation is real enough to train on, but it is not yet a customer-ready monetization machine.

The right first offer remains the AI Workflow Clarity Sprint for one low-regulation local service niche, with HVAC or plumbing as the leading first candidates.

The operating goal is simple: sell a fixed-scope diagnostic and implementation-readiness service, not a vague AI agency promise.

- Current board status: phase3_internal_demo_ready_evidence_warning_private_pilot_blocked.
- Research Scout status: warning. QA Red-Team status: warning.
- QA decision: internal_only. Private pilot prep ready: False.
- Use this training to prepare the operator, offer, demo, and delivery process. Do not use it as launch approval.

TRAINING MODULE 02

What We Are Selling

The Sprint is a five-business-day workflow diagnosis for a small service business that is losing time or leads because intake, follow-up, handoffs, or admin work are messy.

The buyer should understand the pain immediately. The offer should not require them to understand OpenClaw, agents, AI architecture, or no-code tooling.

- One workflow only.
- One clear pain point: missed leads, slow intake, weak follow-up, manual handoffs, or admin drag.
- One output: a practical workflow map, gap list, automation opportunity map, implementation backlog, and synthetic proof/demo.
- No production system change, no credentials, no customer data, and no ROI promise in the first paid version.

TRAINING MODULE 03

Why HVAC Or Plumbing First

HVAC and plumbing are good first niches because the pain is concrete: urgent requests, phone-heavy lead flow, after-hours contact, quote follow-up, and service scheduling friction.

They are easier to explain than broad consulting and less regulated than medical, finance, tax, legal, or insurance workflows.

- A missed call or slow callback is easy for the owner to understand.
- The workflow can be diagnosed without touching private customer systems.
- A synthetic missed-lead demo is credible as a training tool when all fictional data is labeled.
- The offer can stay narrow: response-time workflow, acknowledgement copy, triage rules, escalation path, and owner review report.

TRAINING MODULE 04

What Randall Needs To Know Before Selling

The first risk is not technical. The first risk is overpromising. The pitch must sound practical, grounded, and limited.

You do not need to become a Zapier, Make, n8n, CRM, call tracking, or sales expert before the first test. You do need enough fluency to ask good workflow questions and avoid fake certainty.

- Know the problem: lead leakage, response delays, unclear handoff ownership, and untracked follow-up.
- Know the offer: a diagnostic Sprint, not a full automation build.
- Know the boundary: no customer credentials, production edits, sensitive data, guarantee, or compliance claim.
- Know the close: the first paid pilot buys a clear map and readiness plan, not a magic AI system.

TRAINING MODULE 05

How The OS Will Work

Veritas main stays the control plane. Research Scout gathers public evidence and examples. QA Red-Team challenges claims, proof, privacy, and delivery risk. Veritas integrates the final packet.

This is a deliberate review loop, not always-on autonomous business operation.

- Before offer or niche work: Research Scout gathers source-labeled evidence.
- During drafting: Veritas turns findings into the offer, intake script, demo, and delivery SOP.
- Before customer-facing use: QA Red-Team reviews every claim, deliverable, and boundary.
- After QA: Veritas resolves the blockers and writes the final decision surface.

TRAINING MODULE 06

The Weekly Operating Cadence

While WF75 is active, the minimum cadence should be one short evidence refresh and one QA review each week, plus task-specific agent runs before any material offer change.

- Monday or first work block: Research Scout refreshes one niche, one competitor set, or one proof gap.
- Midweek: Veritas drafts or updates the offer, intake questions, demo, and delivery packet.
- Before end of week: QA Red-Team reviews claims and readiness.
- Veritas closes the loop by updating the board, continuity note, and next action.

TRAINING MODULE 07

Pricing Plan

The first monetization goal is not maximum revenue. It is proof that a real owner will pay for a concrete workflow clarity outcome.

- First 1 to 3 private beta pilots: \$500 to \$750.
- Standard diagnostic after proof: around \$1,500.
- Optional implementation add-on after repeat proof: \$2,500 to \$5,000.
- Do not offer the implementation add-on until the diagnostic is easy to deliver and QA can keep claims clean.

TRAINING MODULE 08

Five-Day Delivery Model

The Sprint should feel simple to the buyer and disciplined internally. The customer sees clarity. The OS handles research, structure, QA, and proof.

- Day 1: intake call, workflow scope, current-state map, and missing-data list.
- Day 2: process reconstruction, failure points, handoff map, and first automation ideas.
- Day 3: synthetic demo or example flow using fictional/anonymized data only.
- Day 4: implementation backlog, tool-stack options, risk boundaries, and cost/effort notes.
- Day 5: final report, walkthrough, recommendations, and optional next-step proposal.

TRAINING MODULE 09

Discovery Call Framework

The discovery call should diagnose whether the owner has a workflow problem worth solving. It should not sound like a technical interrogation.

- Ask what happens when a new service request arrives.
 - Ask who owns the first response and what happens after hours.
 - Ask what information is usually missing before a quote or callback.
 - Ask where leads fall through: calls, forms, email, texts, voicemails, scheduling, or follow-up.
 - Ask what they already use: website forms, CRM, calendar, phone system, call tracking, email, SMS, spreadsheets.
 - Ask what they want reduced: missed calls, manual reminders, double entry, status confusion, or slow follow-up.
-

TRAINING MODULE 10

What Not To Say

The easiest way to damage trust is to make the offer sound more proven than it is. Keep the language conservative until pilot evidence exists.

- Do not claim guaranteed revenue growth.
 - Do not claim a validated 15-minute SLA as an industry rule.
 - Do not claim the 5/10/15/1440 cadence is externally proven.
 - Do not call this compliance-ready, security-vetted, or legally reviewed.
 - Do not imply we can connect to their systems during the diagnostic without separate approval.
 - Do not collect sensitive customer data for the first version.
-

TRAINING MODULE 11

Safe Customer-Facing Language

The first offer can safely use problem-discovery language. It should not use outcome claims that require proof we do not have yet.

- Safe: We map where leads, follow-ups, and handoffs slow down.
 - Safe: We identify practical automation opportunities and risk boundaries.
 - Safe: We produce an implementation-ready workflow plan for one process.
 - Safe: We use a synthetic demo to show the proposed flow without touching live systems.
 - Avoid: We increase revenue by X percent.
 - Avoid: We recover every missed lead.
 - Avoid: This is guaranteed to improve close rates.
-

TRAINING MODULE 12

Tool Fluency Randall Should Build

You need practical fluency, not mastery. The first Sprint can be delivered as diagnosis and planning while we learn the implementation tooling.

- Forms: Google Forms, Typeform, Tally, website forms, CRM intake forms.
 - Automation: Zapier for common simple automations, Make for visual workflows, n8n for self-hostable and more technical flows.
 - Communication: email, SMS providers, voicemail/call tracking, owner notification paths.
 - CRM basics: lead record, contact fields, status, owner, next action, notes, tags.
 - Workflow mapping: trigger, input, decision, action, owner, output, exception, audit trail.
 - Data boundary: what we can see, what we should not see, what must be fictionalized.
-

TRAINING MODULE 13

Operator Preparation Checklist

Before the first paid pilot, Randall should be able to run the conversation, explain the offer, and know where the system stops.

- Pick one niche: recommended first choice is HVAC or plumbing.
- Prepare a one-page offer with conservative language.
- Prepare a 20-minute discovery script.
- Prepare the synthetic missed-lead demo and explain that it uses fictional data.
- Prepare a sample final report so the buyer knows what they receive.
- Prepare a clear no-credential and no-production-change boundary.
- Prepare a simple price and a simple yes/no private pilot decision.

TRAINING MODULE 14

Private Pilot Readiness Gate

Right now, QA says we are not private-pilot-prep-ready. That is useful. It tells us exactly what must be repaired before outreach or payment collection.

- Replace weak, mirrored, or snippet-only evidence with stronger sources.
- Add one public source for the chosen niche on urgency, call dependence, or lead friction.
- Draft the one-page offer.
- Draft the intake script.
- Run QA Red-Team on both before customer-facing use.
- Get explicit approval before outreach, customer data, payment, channel setup, or account creation.

TRAINING MODULE 15

What The Final Deliverable Should Contain

The paid Sprint should end with a useful document that a business owner can act on even if they never hire us for implementation.

- Current workflow map.
- Failure-point list.
- Lead response and handoff risk register.
- Automation opportunity map.
- Tool-stack recommendation with caveats.
- Implementation backlog ranked by effort and value.
- Synthetic demo or mock flow.
- Boundaries, assumptions, and next-step recommendation.

TRAINING MODULE 16

Internal Prompt Pack

These are working prompts for Veritas-mediated agent use. They are internal only.

- Research Scout: Find 10 public HVAC workflow automation, missed-call, or service-intake sources. Return URL, date, claim, source quality, and what can safely be used in offer language.
- Research Scout: Find 8 competitor offers that sell AI workflow audit, automation audit, or lead-response improvement to local businesses. Return price, buyer, promise, deliverables, and proof risk.
- QA Red-Team: Review the one-page AI Workflow Clarity Sprint offer. Flag unsupported claims, privacy gaps, delivery risk, scope creep, and owner-gated actions.
- QA Red-Team: Review the intake script. Make sure it diagnoses workflow pain without collecting sensitive customer data or implying guaranteed results.

TRAINING MODULE 17

30-Day Preparation Plan

This is the practical path from internal readiness to a credible first paid pilot request.

- Week 1: choose the niche, tighten evidence, build the one-page offer, and QA it.
- Week 2: build the intake script, sample final report, and demo walkthrough.
- Week 3: practice the discovery call, price framing, and objection handling with synthetic examples.
- Week 4: prepare the private pilot approval card for Randall's decision on outreach, payment, and any external account actions.

TRAINING MODULE 18

Stop Lines

These are hard boundaries, not preferences.

- No external outreach until approved.
- No payment links or vendor setup until approved.
- No customer data, credentials, or production-system access until separately approved.
- No public/customer delivery claim until QA clears the exact asset.
- No legal, compliance, security, ROI, or guaranteed-performance claims.
- No channel binding, cron dispatch, runtime/config/auth mutation, finance/account action, or paper/live execution.

TRAINING MODULE 19

Immediate Next Actions

The next build should convert this training into customer-adjacent assets, but only after the evidence gap is tightened.

- Pick one first niche: HVAC or Plumbing.
- Run a narrower Research Scout pass for that niche.
- Draft the one-page offer.
- Draft the discovery and intake script.
- Run QA Red-Team against both.
- Prepare a private pilot approval card for outreach and payment decisions.

APPENDIX

Source Stack And Authority Boundary

Source	Path	Status
team_board	state/ai-drop-service-os/team-board.json	phase3_internal_demo_ready_evidence_warning_private_pilot_t
findings_index	tmp/wf75-agent-workspace-findings-index.json	warning_internal_only
demo_packet	tmp/wf75-missed-lead-demo-v1/packet.json	internal_demo_ready_private_pilot_not_ready
implementation_plan	tmp/wf75-ai-drop-service-os-full-implementation-plan.json	internal_plan_ready

Boundary: Internal training only. No outreach, customer delivery, payment setup, external channel binding, cron mutation, config/auth/runtime mutation, customer data, finance/account action, paper/live execution, or owner approval was created by this packet.
