Scenario Outlook

scenario	probability_view	setup	implication	invalidation
Base case	moderate	defensive_review_bias; selective risk-taking only while warnings remain visible.	Favor review-ready quality names in band; keep no- chase discipline.	Macro risk counts worsen or market readiness becomes critical.
Bull case	lower until breadth/freshness improves	Macro warnings fade, breadth improves, and Tier A/B cards move from monitor/no-chase toward review-ready.	Prepare approval cards, not automatic deployment.	Freshness or band/stop gates fail.
Bear case	meaningful tail risk	Data warnings, below-stop names, or macro/geopolitical stress expand.	Raise evidence burden and keep paper pilot fail-closed.	Risk counts normalize and paper-pilot gates mature.

SaaS / SMB Interconnect

Finance OS is the internal truth engine; WF75 is the product-delivery wrapper; SMB remains a service-led adjacent monetization lane.

- Use the finance delivery series as the internal reference standard for what a customer-safe intelligence product should feel like.
- Convert only sanitized, anonymous, source-labeled slices into WF75 customer-safe examples.
- Use SMB workflow deliverables as operational proof of packaging discipline, not as finance advice surfaces.
- Keep real customer identity, suitability, account, tax, retirement, brokerage, and credential data blocked until later gates.
