

WF75 PM Readiness Brief

Generated 2026-06-18T20:05:26Z from validated workspace artifacts

Verdict: WF75 is the active product-readiness sprint: anonymous-scenario internal/service-led work can advance with real public evidence; public/customer/external use remains blocked.

PM UPDATE

ready_for_internal_pm_review

ARTIFACT HANDOFF

ready_for_internal_artifact_only_pm_handoff

SQLITE WAL

control_plane_ready
journal

REQUIRED PROOF

23/23

Operator console: ready validation ok . Use `tmp/wf75-operator-console.json` as the required source for queue, lifecycle, artifact health, scenario, renderer, and PM handoff review; rendered HTML is optional proof only.

COMPLETED THIS WEEK

- PM department skill created and routed for weekly updates, WF75 timelines, roadmaps, and PDF/presentation handoffs.
- PDF skill updated so WF75 PM/readiness packets are first-class internal deliverables.
- WF75 service-led readiness plan exists and validates as internal_service_led_readiness_plan_ready.
- Phase C/D JSON service-state, service-run, operator queue, and movement proof exist for anonymous-scenario handoff.
- SQLite WAL control-plane proof exists for local Veritas artifact refs, queue state, and one-worker claim exclusion.
- Artifact-only PM handoff exists and validates from WF77 bridge, renderer regression, scenario library, service state, operator queue, PM update, and SQLite control-plane proof.
- Retail SaaS operator packet is structurally valid and keeps all customer/external/execution authority false.
- Veritas harness scorecard now classifies command/tool failures separately from validator and authority failures.
- Macro-event calendar is now a first-class proof artifact for CPI, PPI, labor, FOMC, and PCE tracking.

CONTROL-PLANE QUEUE

Field	Current value
Queue item	
Status	unknown
Claim owner	
Claim validation	ok

Enhancements, blockers, and proof

UPCOMING ENHANCEMENTS

- 1-2 / Phase 1: service-state table/JSON contract
- 1-2 / Phase 1: run lifecycle state model
- 1-2 / Phase 1: renderer/export contract
- 1-2 / Phase 1: QA event contract
- 1-2 / Phase 1: infrastructure backlog with stop lines
- 2-4 / Phase 2: anonymous-scenario service-state SQLite or JSON store
- 2-4 / Phase 2: SQLite WAL control-plane proof
- 2-4 / Phase 2: service run writer
- 2-4 / Phase 2: current status query packet
- 2-4 / Phase 2: rollback/backup proof
- 2-4 / Phase 2: production finance-canon isolation proof

BLOCKERS AND DECISIONS

- **service_state_store:** JSON v0 service-state exists when tmp/wf75-service-state-current.json is present; it remains the source proof surface for WF75 service state. Resolution: Keep JSON v0 validator clean and keep supplemental WF77 public price evidence fresh; use SQLite WAL only as a local control-plane index/queue, not as customer/canon truth.
- **operator_console_work_queue:** JSON v0 operator queue exists when tmp/wf75-operator-queue.json is present. Resolution: Keep the queue validator clean and consume it through the local operator console/control cockpit.
- **operator_console_control_cockpit:** Local operator console/control cockpit exists when tmp/wf75-operator-console.json and .html validate cleanly. Resolution: Use the console as the primary internal WF75 operating view while keeping it local-only and artifact-backed.
- **sqlite_wal_control_plane:** SQLite WAL control-plane proof exists when tmp/wf75-service-state-sqlite.json and tmp/wf75-service-state.sqlite are present. Resolution: Keep WAL, busy_timeout, foreign_keys, artifact refs, queue rows, and one-worker claim exclusion validating; do not treat the DB as finance canon, customer DB, approval authority, SQL/ticker import, or execution surface.
- **customer_safe_renderer_export_pipeline:** Reusable local renderer/export regression proof exists when tmp/wf75-renderer-export-regression.json is present; a full UI/operator console remains future work. Resolution: Keep the renderer/export regression harness clean and fail-closed before any new scenario, UI surface, or PM handoff consumes the outputs.
- **qa_regression_harness:** Compact repeated-run regression proof exists when tmp/wf75-renderer-export-regression.json is present; future expansion should add more seeded edge cases only when they represent real failure modes. Resolution: Keep clean scenarios passing and seeded-bad scenarios failing before treating any regenerated output as review-ready.
- **scenario_template_library:** Anonymous scenario-template library exists when tmp/wf75-scenario-template-library.json is present; future work should expand it only with validator-backed scenario needs. Resolution: Maintain at least three anonymous scenarios covering AI infrastructure, Materials diversification, and supplemental-price/risk edge cases without fake-person profiles.
- **artifact_only_pm_handoff:** Artifact-only PM handoff exists when tmp/wf75-artifact-only-pm-handoff.json validates cleanly. Resolution: Keep the handoff fed by WF77 bridge, renderer regression, scenario library, service state, operator queue, PM weekly update, and SQLite WAL control-plane proof.

TRUST GATES

- No items surfaced.

Boundary: Internal review/proof only. No public launch, real customer data, external delivery, source-licensing claim, legal/compliance claim, portfolio/canon mutation, trading, account, paper/live action, or owner approval inference.
