

INTERNAL TRAINING / FAKE-SCENARIO PRACTICE ONLY

WF75 Academy / Training Desk

Train Randall to understand, sell, review, and manually deliver SMB workflow automation packets before fake-scenario practice and later real-client pilots.

Daily cadence 20-30 minutes	Weekly review 45-60 minutes	First target SMB workflow packets
---------------------------------------	---------------------------------------	---

REPEATABLE SESSION FORMAT

- 5 minutes: concept in plain English
- 10 minutes: inspect one fake scenario
- 10 minutes: design the workflow or automation shape
- 5 minutes: QA stop-line review
- optional 5 minutes: Randall explains it back

Boundary: This is internal readiness training. No real customer data, outreach, credentials, implementation, external delivery, spending, public launch, guaranteed ROI, legal/compliance/security readiness, or certification claim.

Actual training module / Day 1

SMB Service-Led Offer Basics

OBJECTIVE

Randall can explain the SMB Workflow Clarity service in plain English, including scope, exclusions, and the next step.

PLAIN-ENGLISH LESSON

Small businesses often do not need a new SaaS platform first. They need someone to show them where the current workflow is leaking attention, leads, follow-up, appointments, quotes, or cash.

Our first service is a manual Workflow Clarity packet. We inspect a sanitized or fake scenario, map what is happening, identify where work stalls, and produce a practical owner-facing packet.

The packet can include a daily attention list, lead status cleanup, callback priority, suggested scripts, simple tracking fields, and a tool-stack recommendation.

We do not promise revenue. We do not touch real customer systems yet. We do not ask for credentials. We do not send messages for them. We start with diagnosis and a manual packet because that is faster, safer, and easier to sell than a full SaaS build.

KEY TERMS

- **Service-led SaaS:** A manual service that proves the workflow and customer value before software automation is fully built.
- **Lead Rescue:** Finding and prioritizing missed or stalled inquiries so the owner knows who needs attention first.
- **Workflow Clarity packet:** A structured deliverable showing the workflow, bottlenecks, next actions, scripts, and tool recommendations.
- **Stop line:** A boundary we do not cross without explicit approval, such as real customer data, credentials, outreach, or implementation.

WORKED EXAMPLE

Scenario: Desert Peak HVAC misses 12 calls in a week. Some callers leave voicemails, some submit forms, and quotes are not followed up consistently.

Weak version: We use AI to automate your whole business and recover lost revenue fast.

Why weak: It overpromises revenue, implies implementation, and sounds like hype.

Better version: We help you see where calls, forms, quotes, and follow-ups are slipping through the cracks. First we create a clear manual packet showing who needs attention, what status each lead is in, what message or callback should happen next, and which simple tools could support the workflow. We do not need your credentials or customer-system access for the first review.

PRACTICE STEPS

- State the customer pain in one sentence.
- State what we produce in one sentence.
- State what we do not do yet.
- State the next step: a sanitized intake or fake-scenario review.

SELF-CHECK

- Did I avoid promising revenue?
- Did I avoid saying we will implement everything?
- Did I avoid asking for credentials?
- Did I explain the manual packet clearly?
- Did I give a concrete next step?

Answer key: A strong answer says we diagnose workflow leakage and produce a manual owner packet first. It names missed calls/forms/quotes/follow-ups, gives a practical deliverable, preserves boundaries, and asks for a sanitized intake or fake-scenario review as the next step.

Actual training module / Day 2

Workflow Diagnosis: Trigger To Outcome

OBJECTIVE

Randall can map a workflow using trigger, handoff, wait state, owner, and outcome.

PLAIN-ENGLISH LESSON

A workflow is not just a task list. It is the path from something happening to a result being achieved.

Most SMB workflow problems happen at handoffs and wait states: nobody owns the next touch, the status is unclear, or the same work is tracked in too many places.

Before recommending software, map what triggers the work, who owns each step, where it waits, and what outcome the business actually wants.

KEY TERMS

- **Trigger:** The event that starts the workflow.
- **Handoff:** The moment responsibility moves from one person, system, or step to another.
- **Wait state:** Where the workflow pauses until someone acts or information arrives.
- **Outcome:** The business result the workflow exists to produce.

WORKED EXAMPLE

Scenario: A contractor receives a job request, visits the site, sends a quote, waits for approval, schedules materials, completes work, and sends an invoice.

Weak version: You need a CRM.

Why weak: It jumps to a tool before identifying the real bottleneck.

Better version: The issue appears to be quote follow-up and invoice timing. We should map owner, due date, and next touch before recommending a tool.

PRACTICE STEPS

- Name the trigger.
- List each handoff.
- Mark each wait state.
- Assign an owner to the next touch.
- Define the outcome.

SELF-CHECK

- Did I identify the trigger?
- Did I find at least one wait state?
- Did I assign ownership?
- Did I avoid tool-first thinking?

Answer key: A strong workflow diagnosis names the start event, handoffs, wait states, owner, and desired outcome before proposing automation.

Day 1 / 20 minutes

SMB Service-Led Offer Basics

LEARN

- what the Lead Rescue / Workflow Clarity Sprint is
- what it is not
- why manual packets come before full SaaS

ACTIVITY

Explain the offer in 90 seconds without saying implementation, guaranteed revenue, or AI magic.

SIMULATION

Desert Peak HVAC lead follow-up packet

ACCEPTANCE

Randall can state scope, exclusions, and next step clearly.

Day 2 / 25 minutes

Workflow Diagnosis: Trigger To Outcome

LEARN

- trigger, handoff, wait state, owner, outcome
- where manual workflows break
- how to avoid recommending tools too early

ACTIVITY

Map one fake contractor admin workflow from first customer request to invoice.

SIMULATION

small contractor job-control packet

ACCEPTANCE

Randall can identify trigger, bottleneck, owner, and next action.

Day 3 / 25 minutes

Zapier Fundamentals

LEARN

- trigger -> action -> filter -> path -> log
- when Zapier is enough
- why task volume and permissions matter

ACTIVITY

Design a fake Zap: website form -> owner alert -> Google Sheet row.

SIMULATION

cleaning company website lead intake

ACCEPTANCE

Randall can explain a Zap without touching real accounts.

Day 4 / 25 minutes

Make Fundamentals

LEARN

- scenario, module, route, filter, bundle
- when Make is better than Zapier
- duplication and route-testing risks

ACTIVITY

Design a fake Make scenario that routes med-spa inquiries by treatment interest.

SIMULATION

med spa inquiry routing

ACCEPTANCE

Randall can explain one Make scenario and its failure mode.

Day 5 / 20 minutes

Simple CRM / Sheet Control Plane

LEARN

- why Google Sheets/Airtable can be enough at first
- status labels and owner fields
- what belongs in a lead/job tracking table

ACTIVITY

Create fake columns for lead status, next touch, priority, source, owner, and due date.

SIMULATION

auto repair quote follow-up list

ACCEPTANCE

Randall can explain a simple tracking table before recommending CRM.

Day 6 / 25 minutes

Phone/SMS Workflow Tools

LEARN

- OpenPhone vs Twilio mental model
- missed-call text-back concepts
- SMS consent and opt-out sensitivity

ACTIVITY

Write a safe internal recommendation for missed-call callback priority without sending texts.

SIMULATION

plumbing missed-call queue

ACCEPTANCE

Randall can separate tool recommendation from message sending.

Day 7 / 25 minutes

Customer Packet QA

LEARN

- private-data leakage checks
- credential and implementation stop lines
- ROI/legal/compliance claim blocks

ACTIVITY

Review one fake customer preview and mark unsafe lines.

SIMULATION

Lead Rescue customer preview

ACCEPTANCE

Randall catches unsafe claims before delivery.

30-Day Rollout Training Track

Practice the service-led rollout with fake scenarios before any real outreach, customer data, credentials, implementation, or ROI claim is allowed.

30-day rollout rehearsal / Week 1

Internal demo and approval preparation

GOAL

Choose the first vertical, pick the demo path, rehearse the offer, and draft the approval card.

PRACTICE

- explain the Lead Rescue offer in 90 seconds
- choose the HVAC / plumbing / electrical demo path
- write the no-outreach approval card
- state every stop line out loud

MOCK SCENARIOS

- smb-missed-call-capture-v1
- smb-owner-attention-dashboard-v1

ACCEPTANCE

Randall can explain the offer and approval gate without implying public launch, outreach, ROI, credentials, or implementation.

30-day rollout rehearsal / Week 2

Warm-list and conversation rehearsal

GOAL

Practice discovery, objection handling, and sanitized intake boundaries before any real contact.

PRACTICE

- run a discovery roleplay
- ask for sanitized workflow description only
- answer common objections without hype
- mark bad-fit conversations cleanly

MOCK SCENARIOS

- smb-lead-intake-routing-v1
- smb-follow-up-sequences-v1

ACCEPTANCE

Randall can complete a fake discovery call and keep all data, messaging, credential, and ROI boundaries intact.

30-day rollout rehearsal / Week 3

Paid pilot delivery rehearsal

GOAL

Run the manual delivery flow against fake inputs before a real paid pilot is approved.

PRACTICE

- build a lead-flow map
- build an owner attention queue
- draft follow-up examples for human review
- write the automation blueprint handoff

MOCK SCENARIOS

- smb-lead-status-tracking-v1
- smb-script-message-pack-v1

ACCEPTANCE

Randall can produce a mock pilot packet and explain what remains blocked until exact owner approval.

30-day rollout rehearsal / Week 4

Closeout, proof, and retainer offer rehearsal

GOAL

Practice pilot recap, no-hype proof framing, retainer-fit judgment, and next-step recommendation.

PRACTICE

- write a pilot closeout summary
- separate observations from ROI claims
- choose continue, retainer, or no-fit
- name the next safe experiment

MOCK SCENARIOS

- smb-sales-pipeline-cleanup-v1
- smb-tool-stack-recommendation-v1

ACCEPTANCE

Randall can close the loop without overclaiming results or turning a pilot into unapproved implementation.

Tool Curriculum

Tool	Learn for	Starter pattern	Do not do yet
Zapier	simple app-to-app automations	form submission -> owner alert -> tracking row	connect real client accounts or send external messages
Make	branching workflows and data routing	inquiry -> classify -> route -> log	build production scenarios for clients
n8n	more technical/self-hosted automation concepts	webhook -> validate -> transform -> queue	self-host or maintain client infrastructure
Google Sheets / Airtable	simple operating tables and status boards	lead/job row -> status -> owner -> next touch	store sensitive real data casually
OpenPhone / Twilio	phone/SMS workflow concepts	missed call -> internal alert -> manual callback queue	send real customer messages or handle phone-number migration

Stop Lines

- real_customer_data_allowed
- customer_outreach_allowed
- external_delivery_allowed
- credential_access_allowed
- customer_system_implementation_allowed
- public_launch_allowed
- spend_or_subscription_allowed
- guaranteed_revenue_or_roi_claim_allowed
- legal_compliance_security_readiness_claim_allowed
- owner_approval_inferred
